

Item Response Models for Translation in CNS disorders

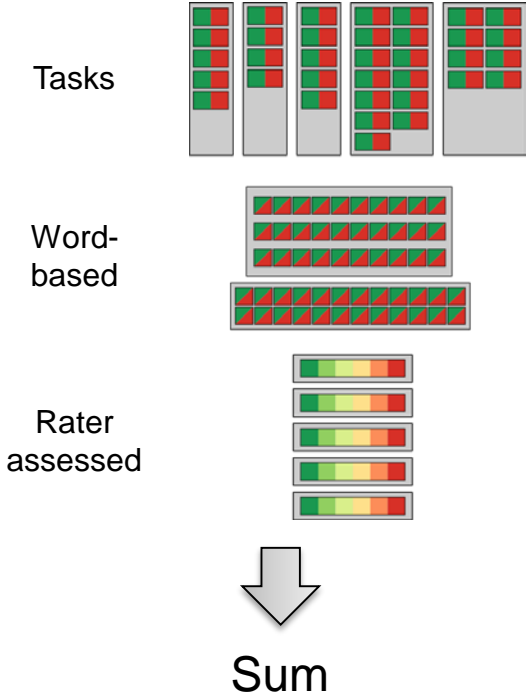

Mats O Karlsson and Sebastian Ueckert

Pharmacometric Research Group
Department of Pharmaceutical Biosciences
Uppsala University
Uppsala, Sweden

Composite endpoints

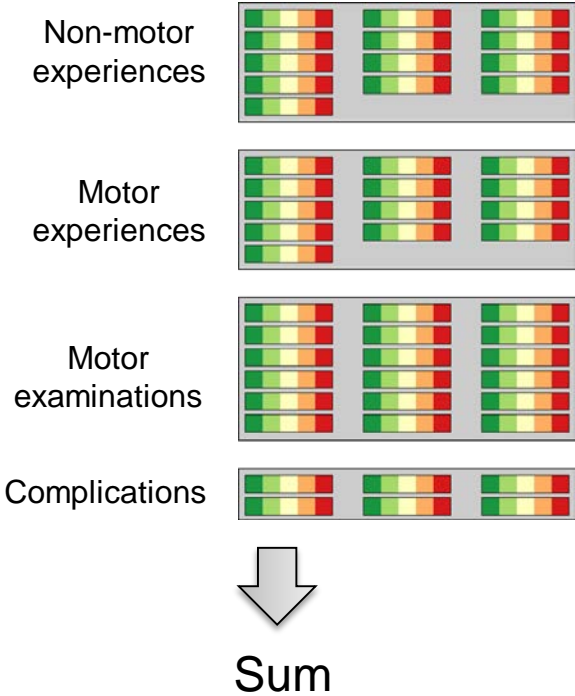

Alzheimer's Disease

Alzheimer's Disease Assessment Scale - Cognition (ADAS-Cog)

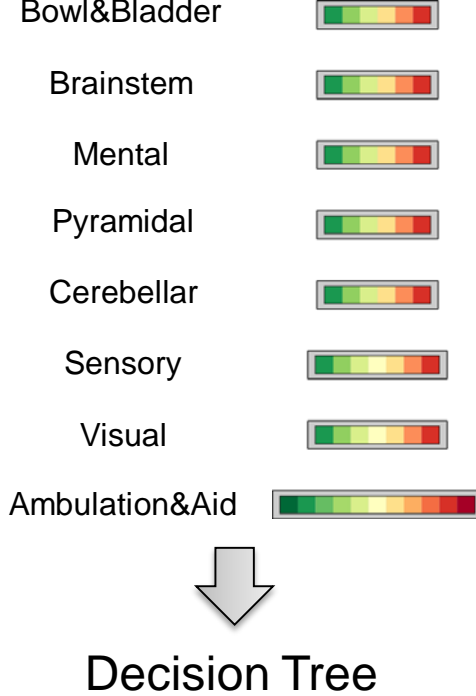

Parkinson's Disease

Movement Disorder Society - Unified Parkinson's disease rating scale (MDS-UPDRS)

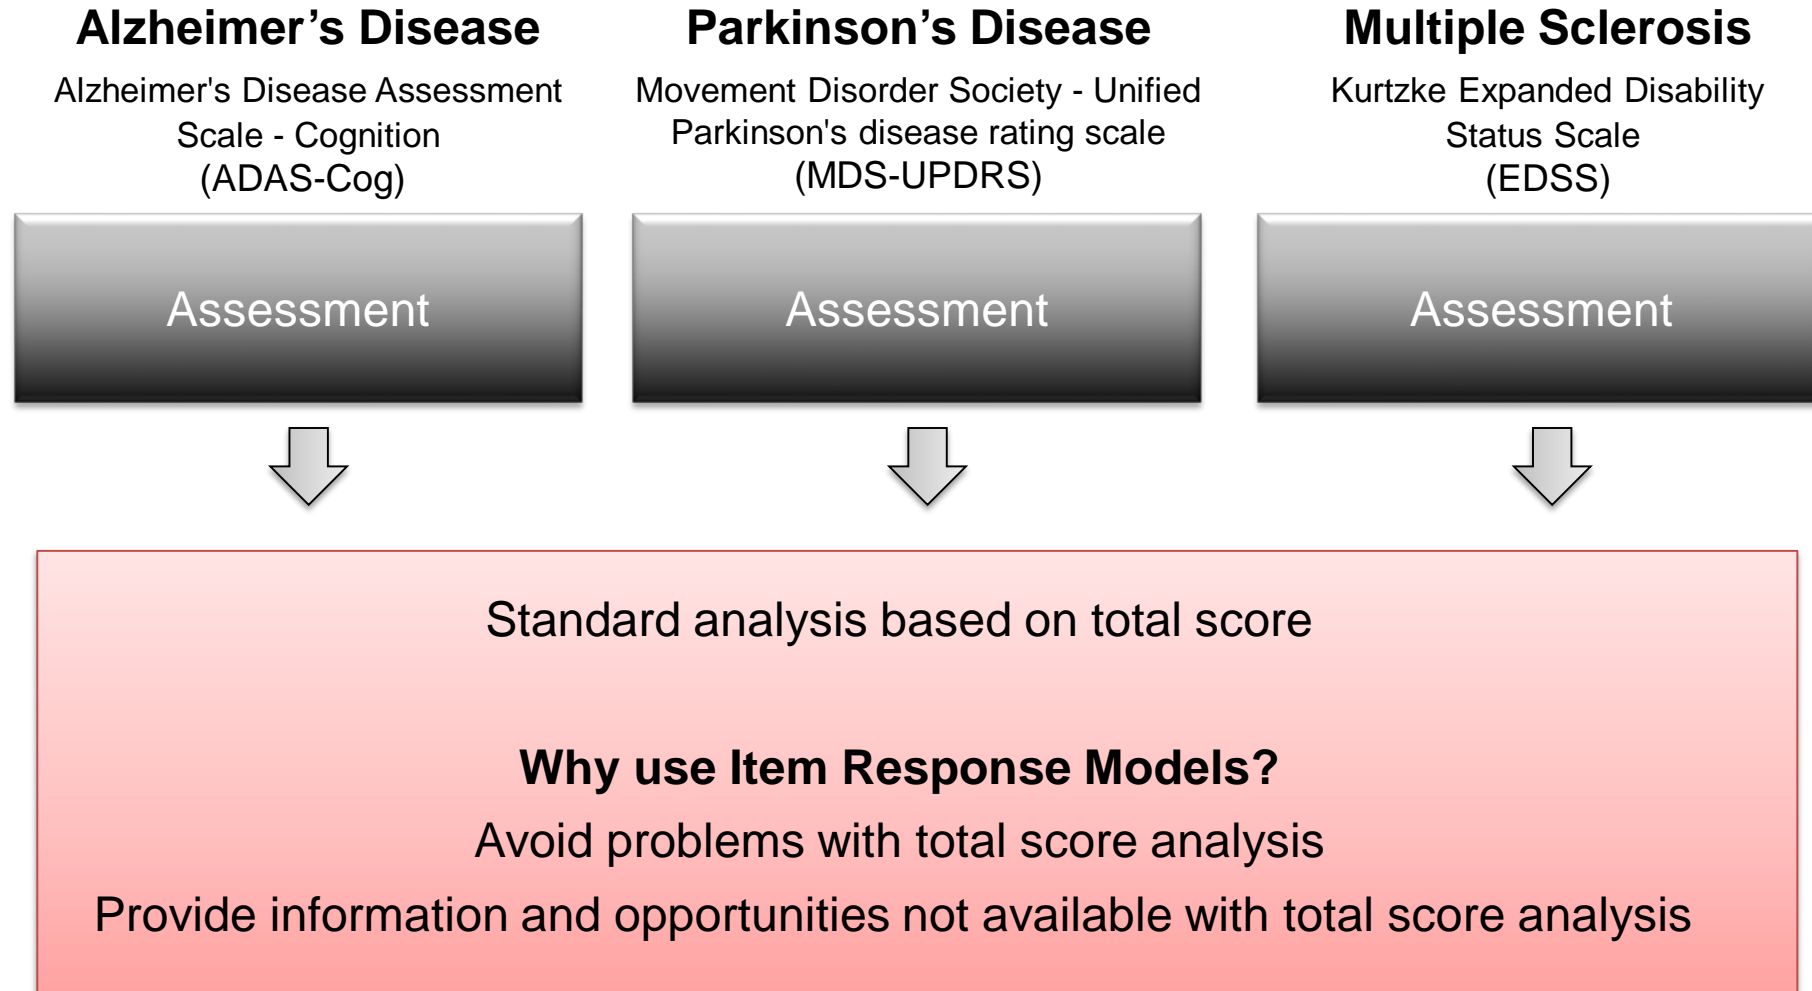

Multiple Sclerosis

Kurtzke Expanded Disability Status Scale (EDSS)

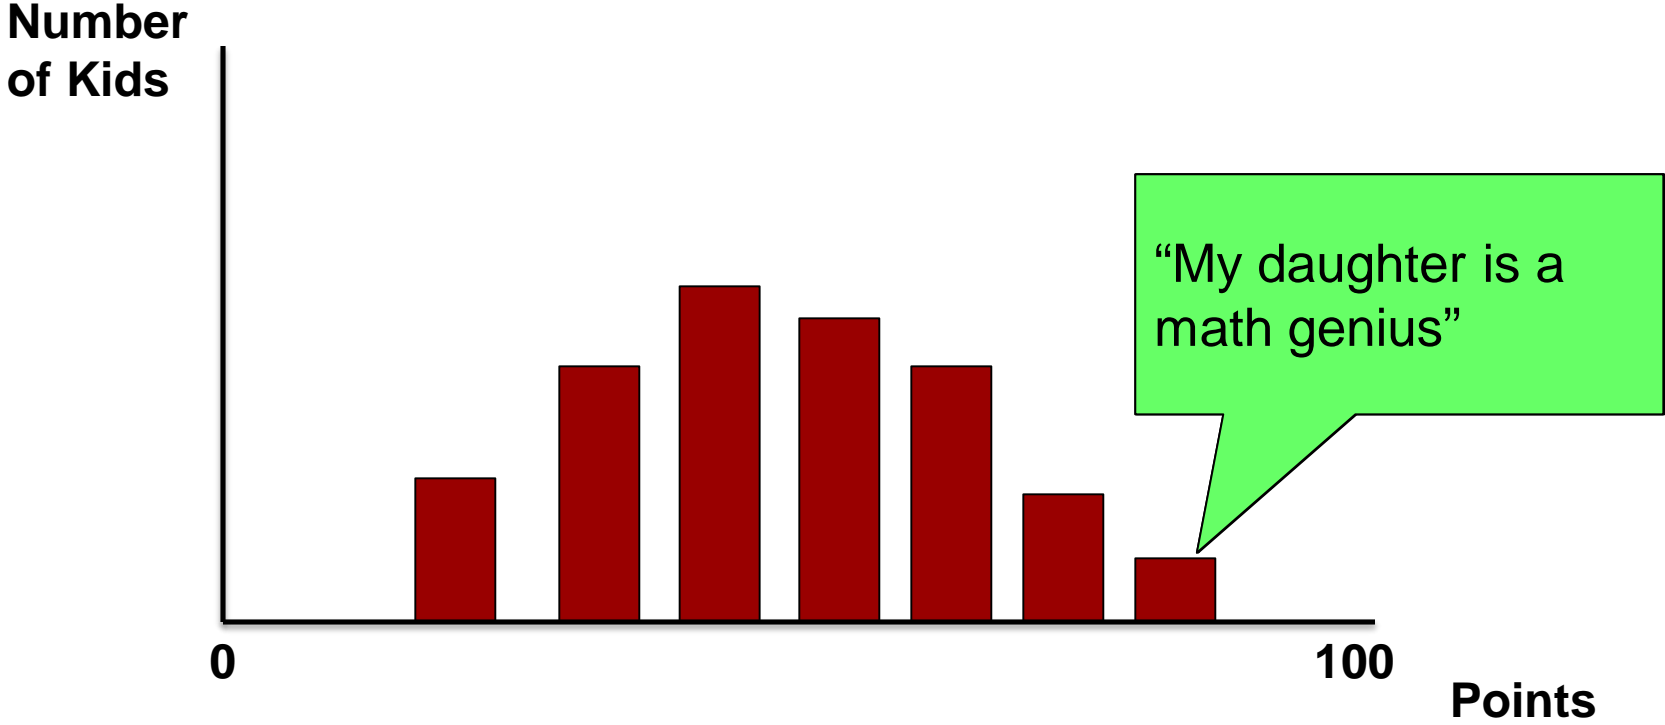

Models describe change in composite endpoints over time

Composite endpoints & pharmacometric modeling

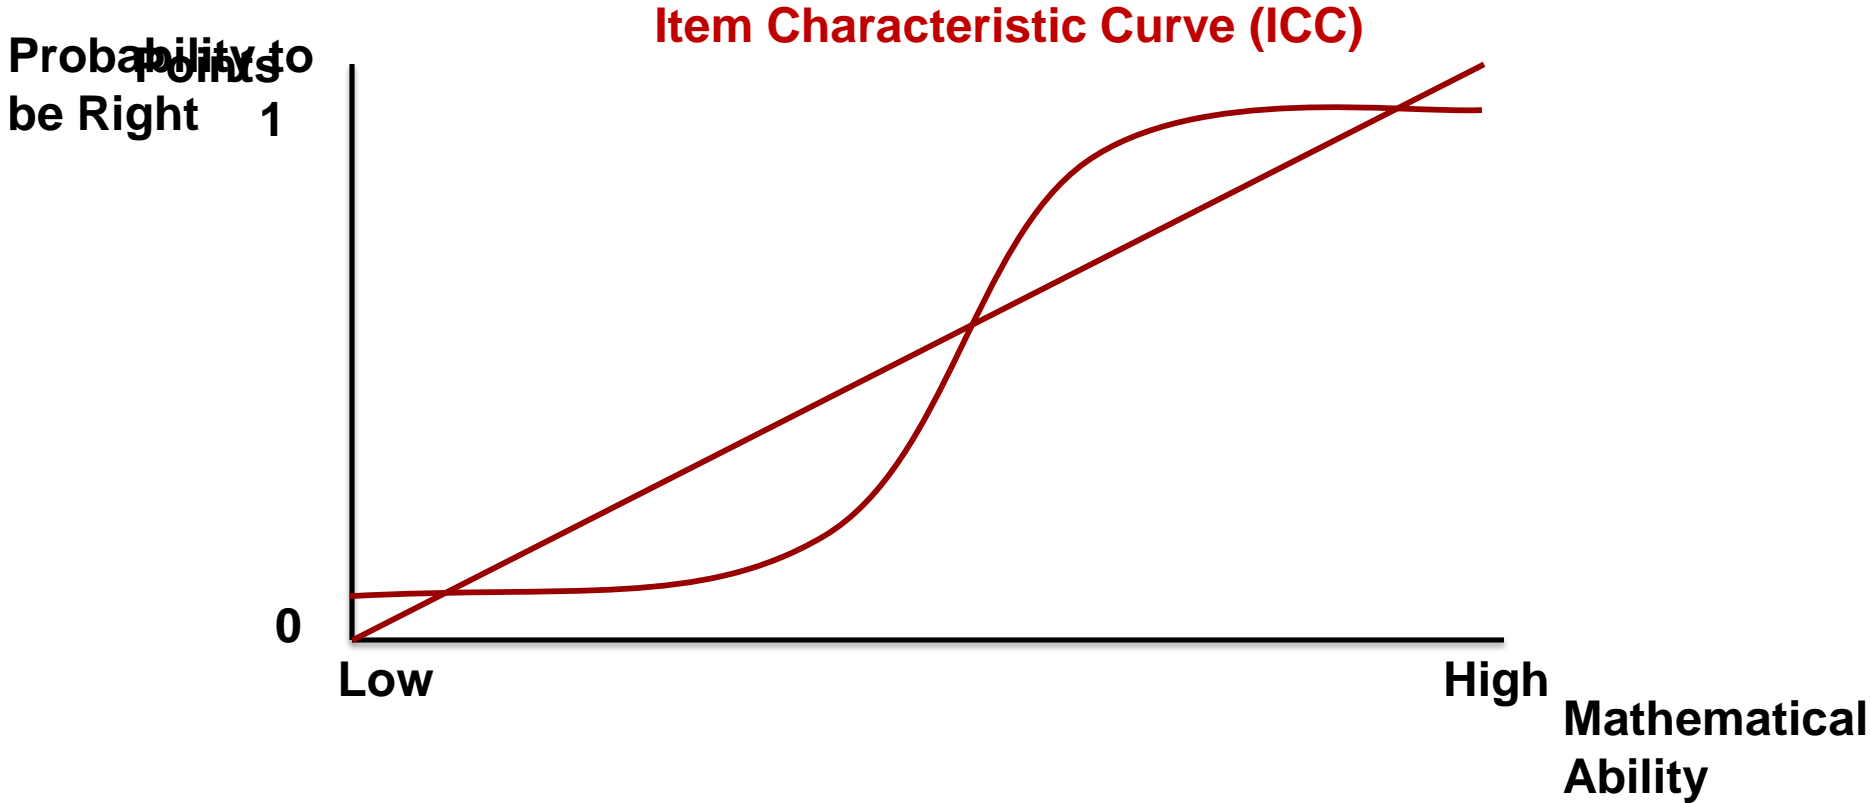

Item Response Theory (IRT) - Concept

Item Response Theory (IRT) - Concept

Item Response Theory (IRT) - Concept

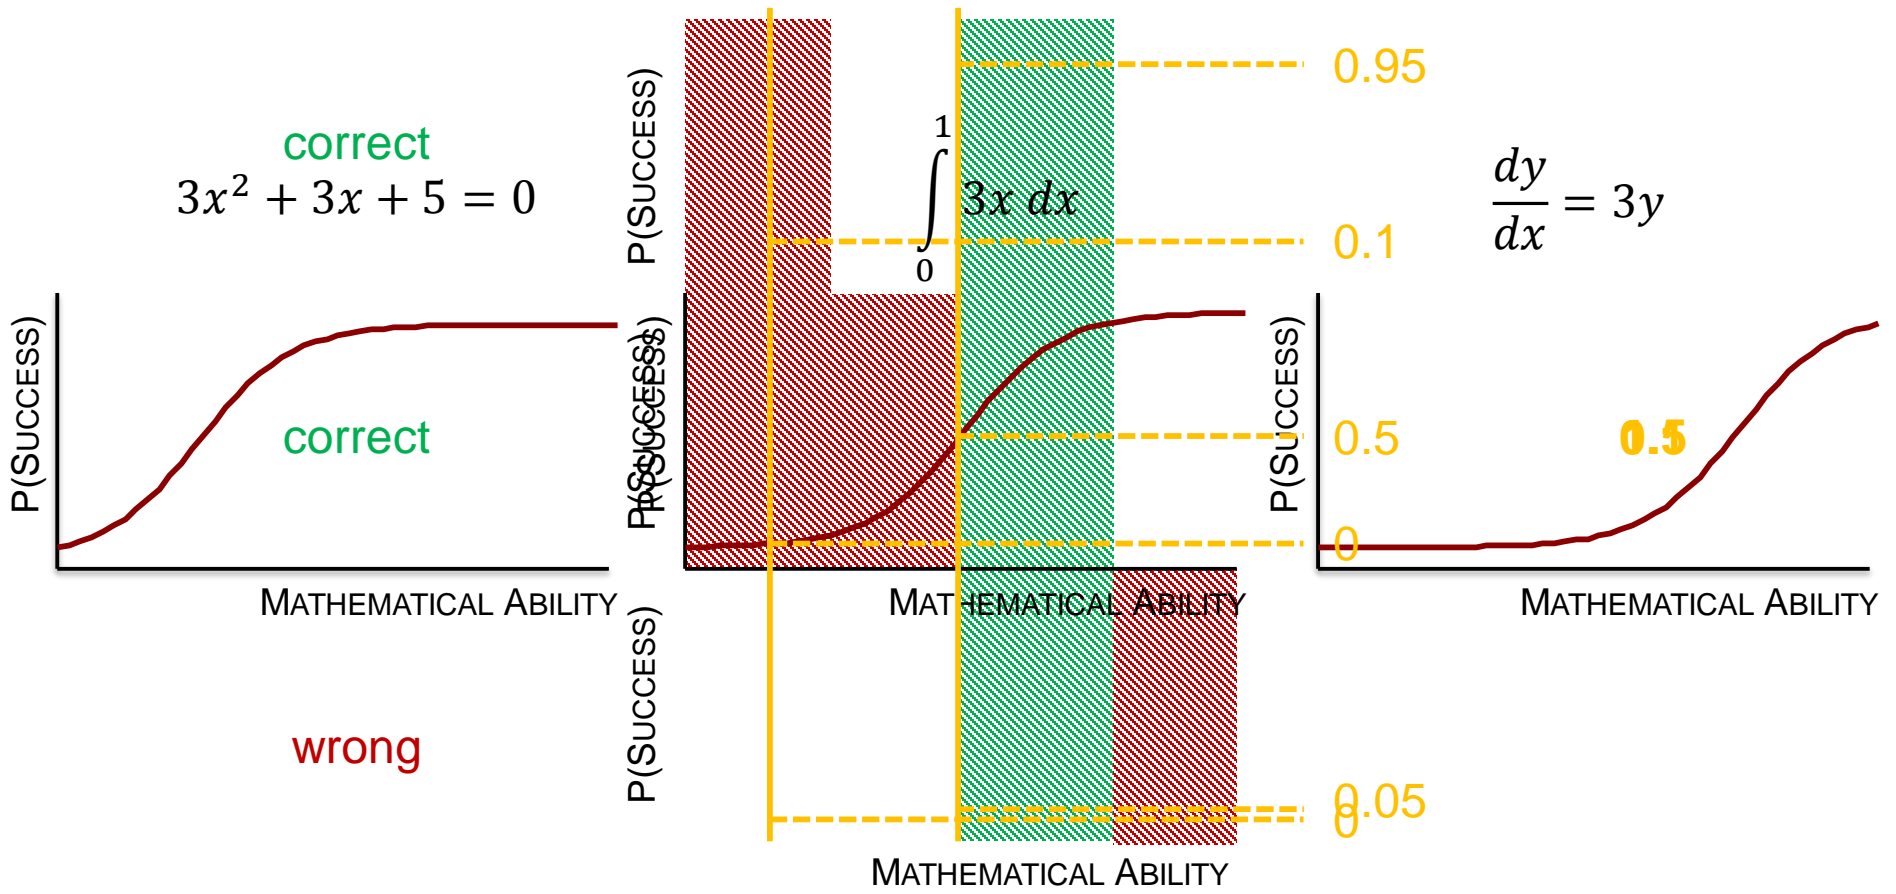

Item Response Theory (IRT) - Concept

- From intuition:
 - Scores are interpreted as measure of ability
 - Mathematical ability can't be observed and is clearly hypothetical
 - Exam itself is of no particular interest, but acts a surrogate measure for ability

IRT formalizes this intuition

Item Response Theory (IRT) - Concept

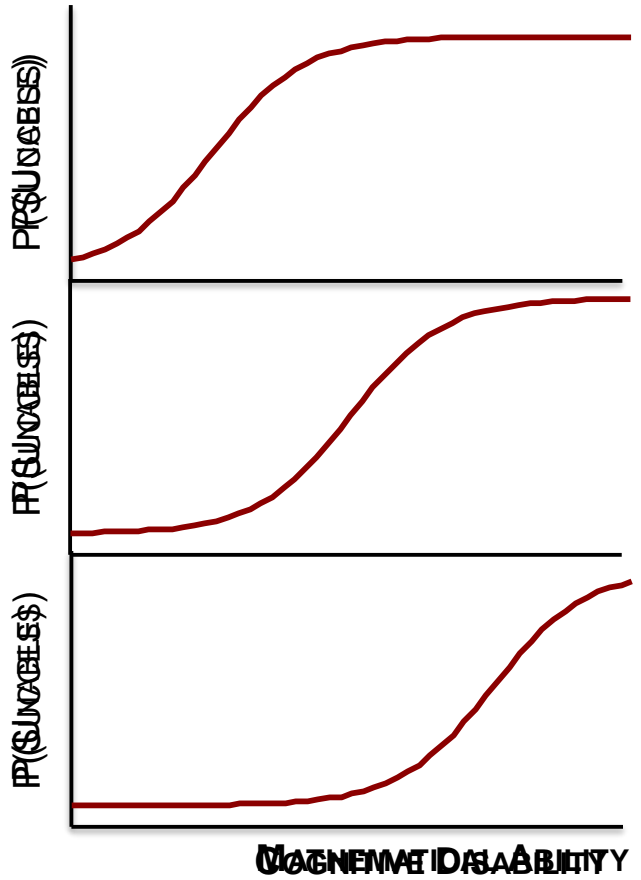

Item Response Theory (IRT) - Concept

$$3x^2 + 3x + 5 = 0$$

$$\int_0^1 3x \, dx$$

$$\frac{dy}{dx} = 3y$$

←? "Name the date"

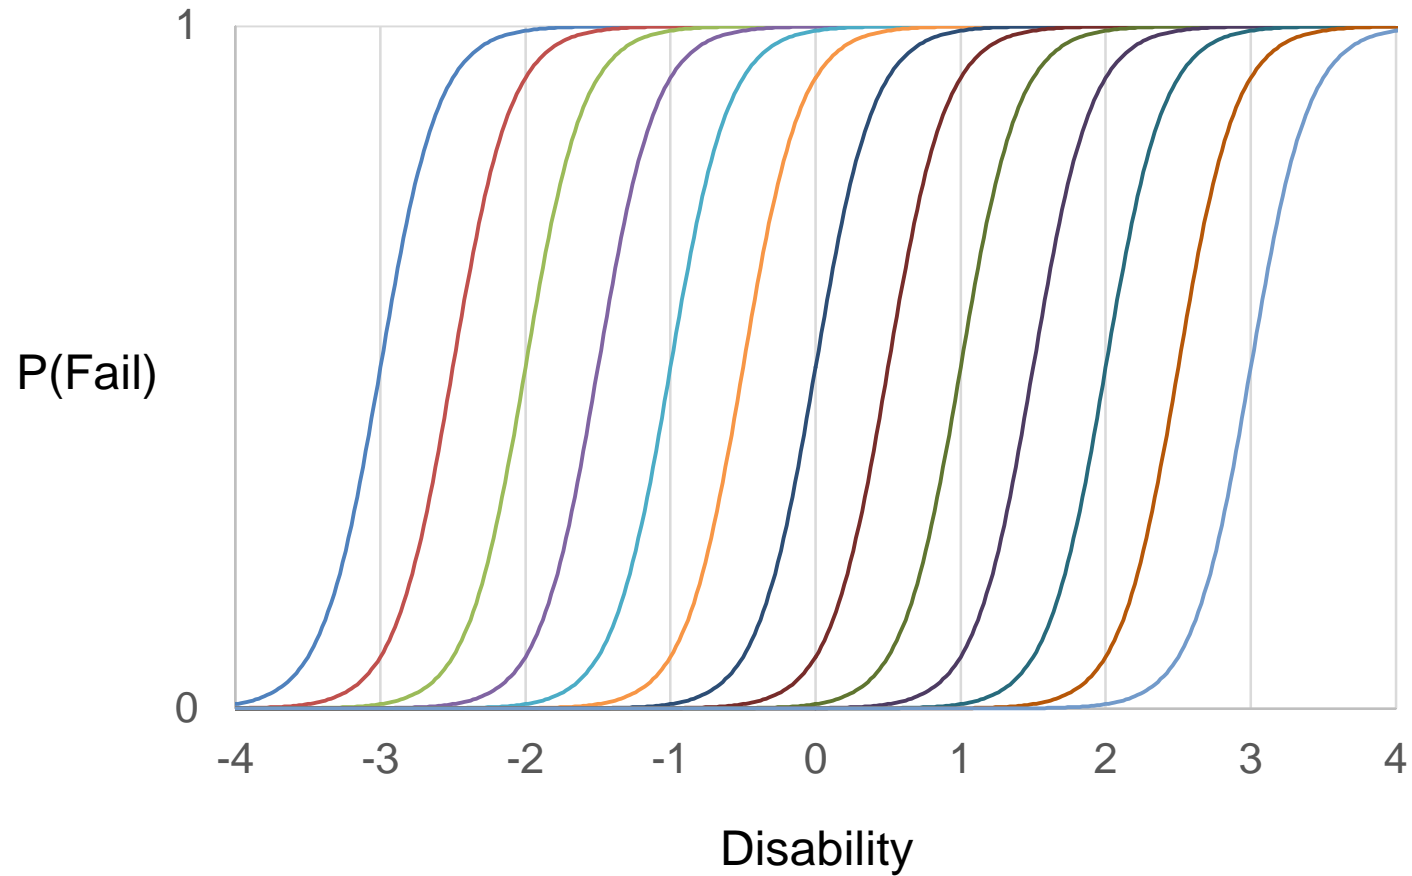

"Draw a circle"

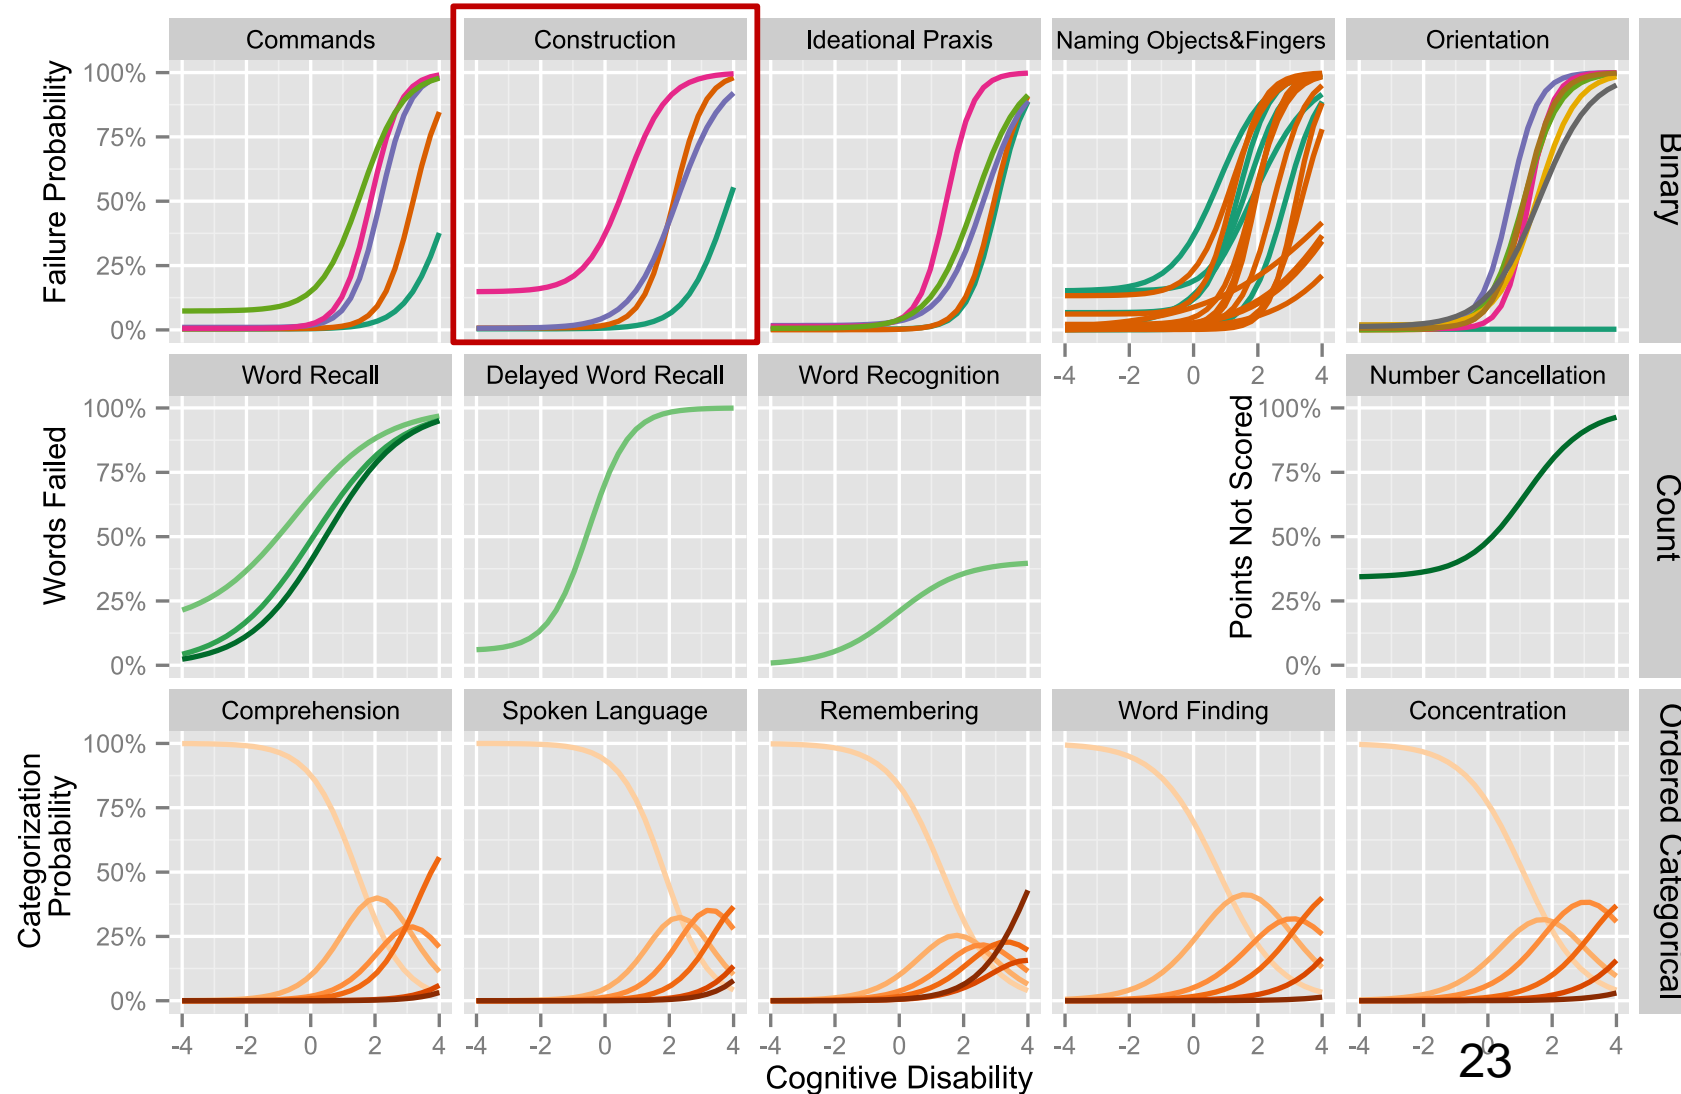

"Make a fist"

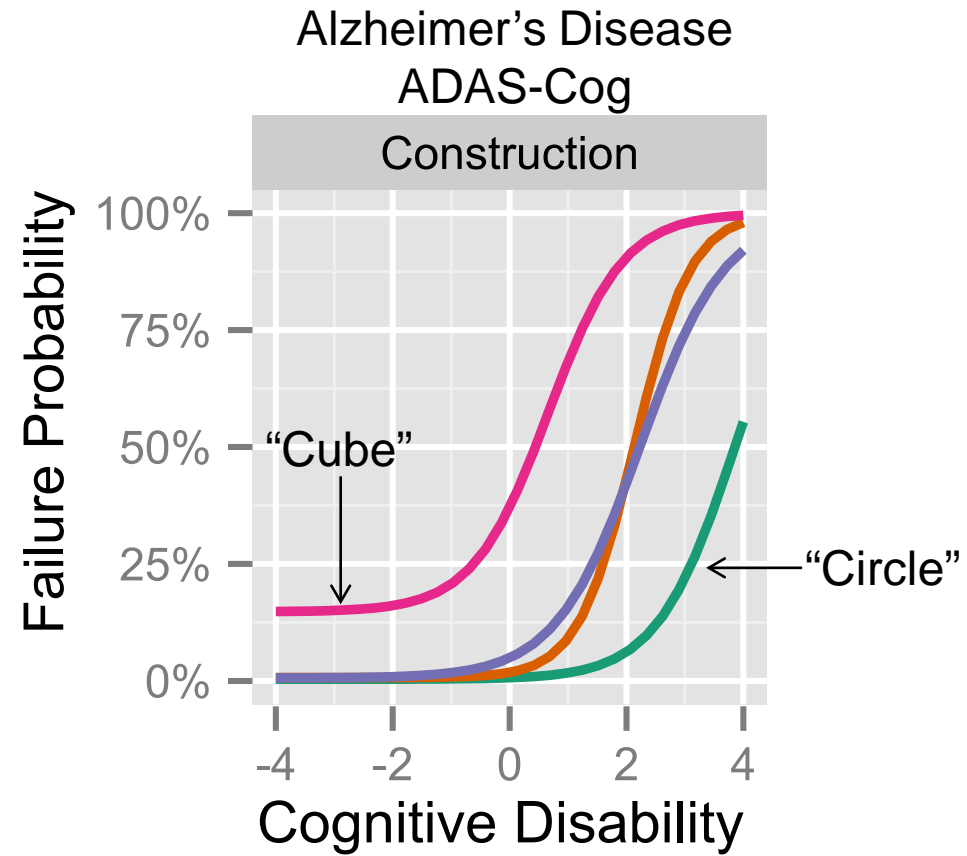

ICCs in a near-perfect composite scale

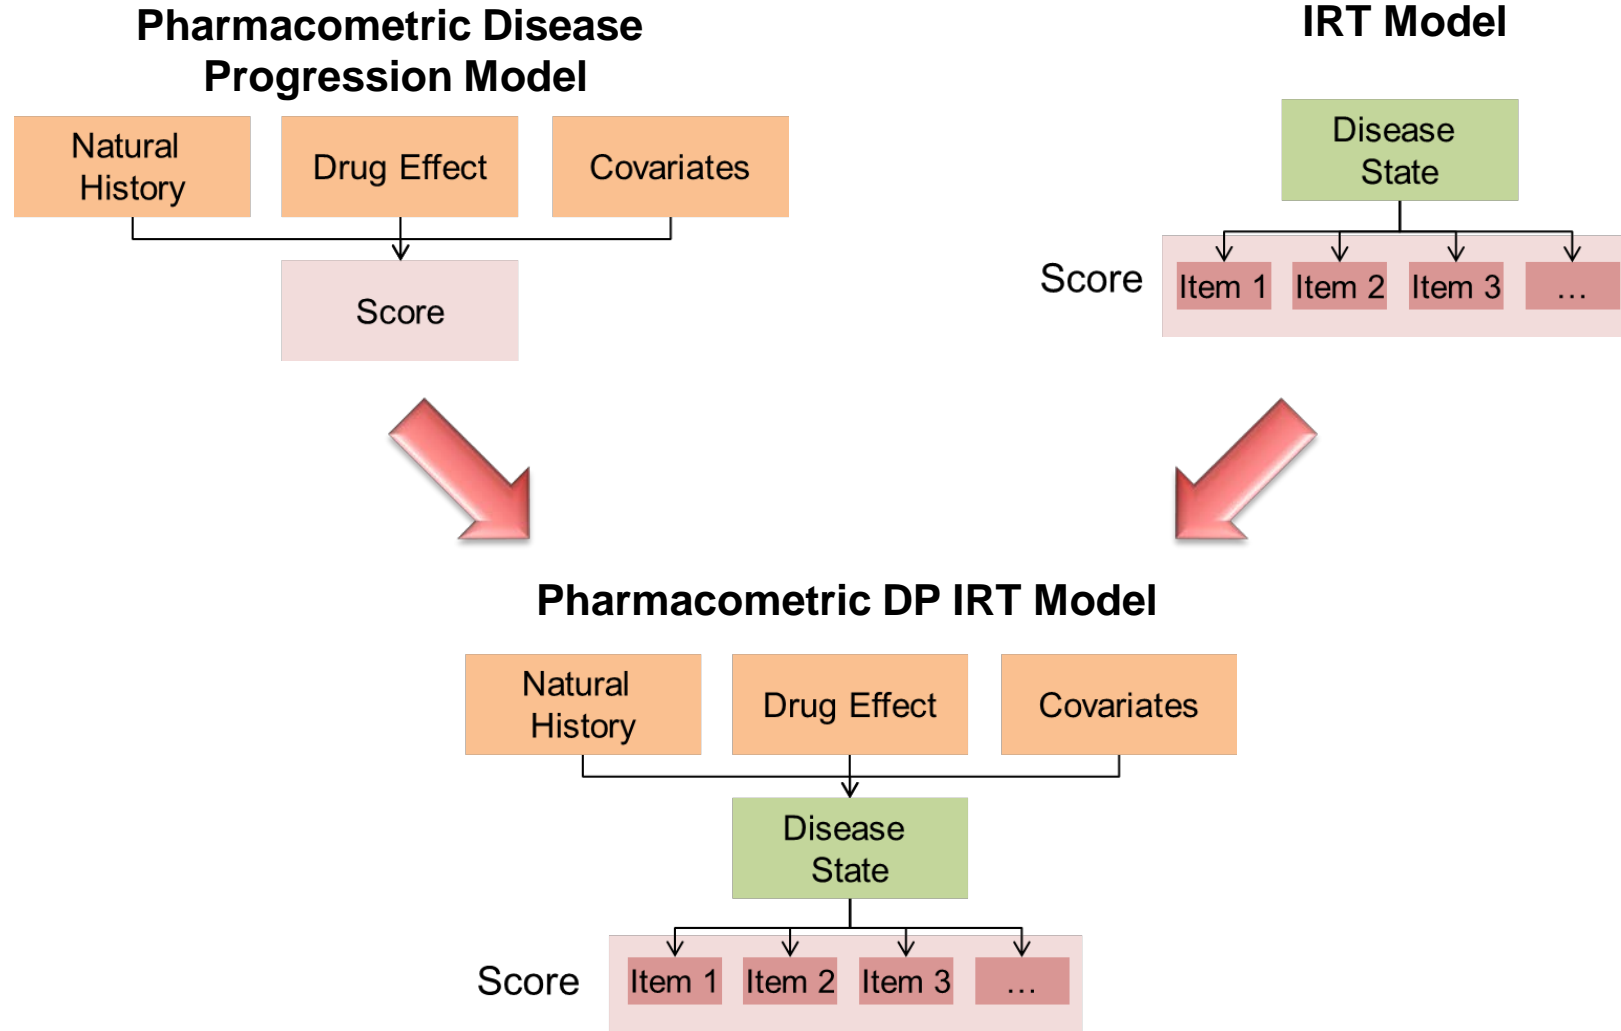

ICCs ADAS-Cog

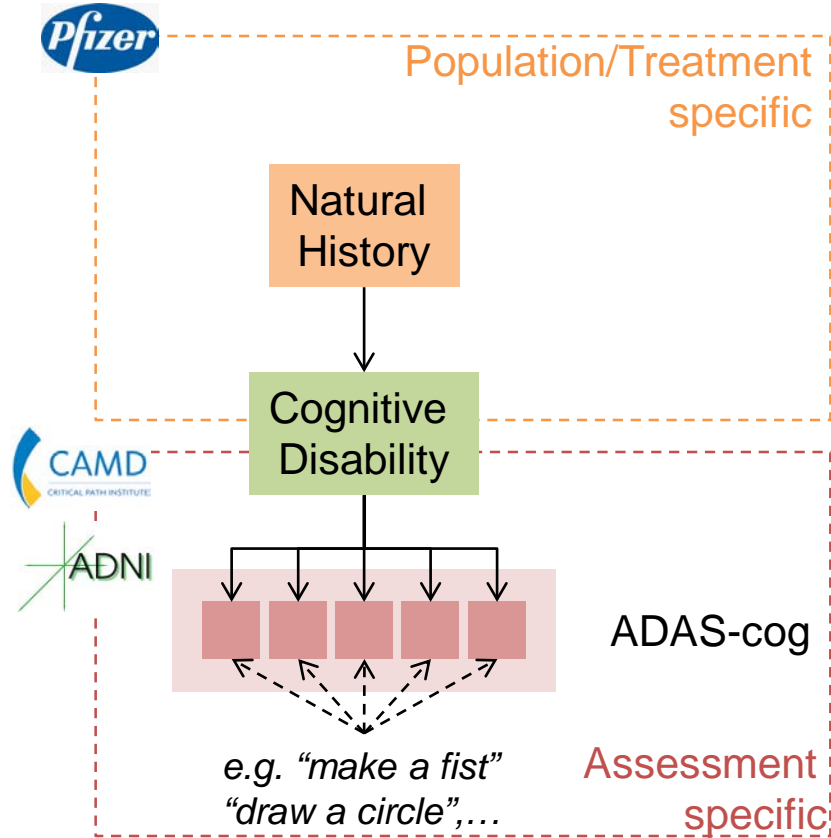

ICCs ADAS-Cog construction

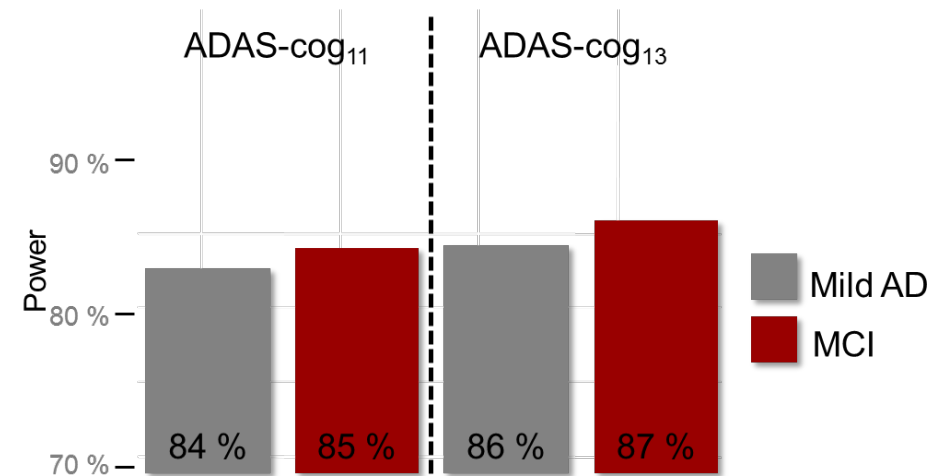

IRT & Pharmacometric Modeling

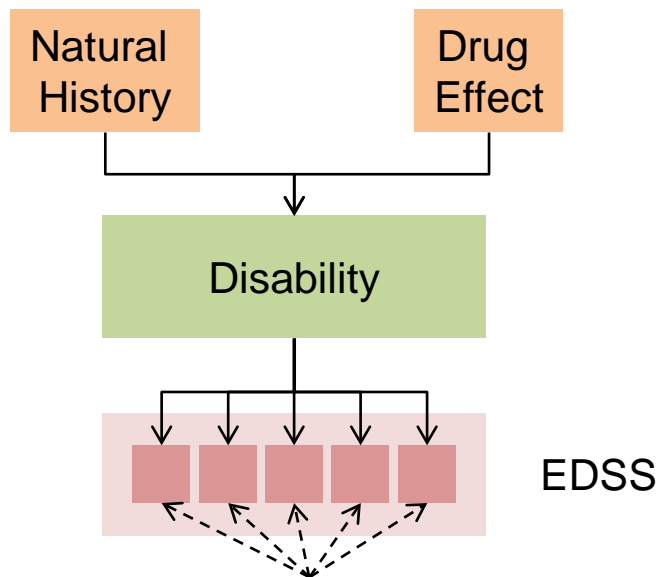

Example: Alzheimer's Disease

- + Utilize data from public or in-house clinical trial databases
- + Study influence of patient **population** & **assessment** variant independent from another

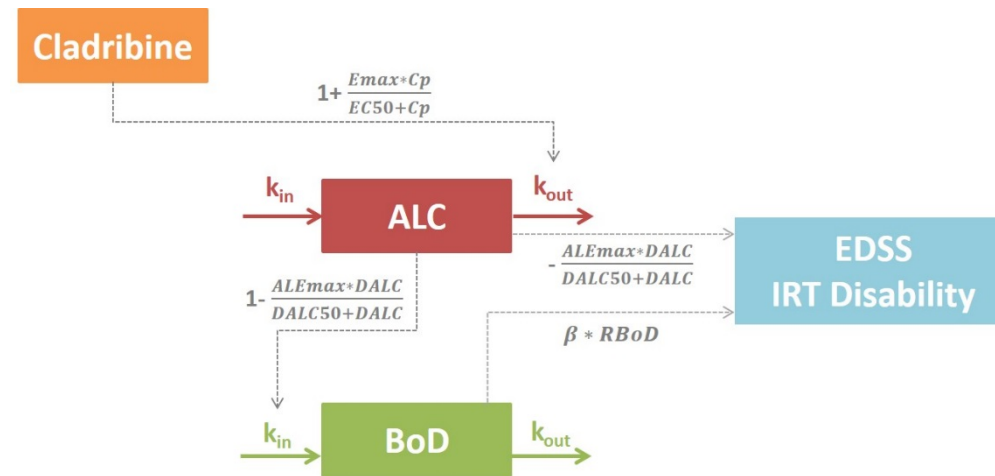

Example: Multiple Sclerosis (2)

1st generation model

2nd generation model

Item information

ITEM	Information	% Total Inf.
Cerebellar	2.18	33.98
Pyramidal	1.62	25.28
AmbAid	1.14	17.8
Bowel&Bladder	0.45	7
Brainstem	0.37	5.81
Cerebral	0.29	4.54
Sensory	0.28	4.39
Visual	0.08	1.21

>80%

Component	Information	% Total
1 Delayed Word Recall	4.79	33.6
2 Word Recall	3.81	26.7
3 Orientation	1.64	11.5
4 Word Recognition	1.40	9.8
5 Naming O&F	0.82	5.7
6 Number Cancellation	0.37	2.6
7 Construction	0.29	2.0
8 Word Finding	0.20	1.4
9 Ideational Praxis	0.18	1.3
10 Concentration	0.18	1.2
11 Remembering	0.16	1.1
12 Comprehension	0.16	1.1
13 Commands	0.15	1.1
14 Spoken Language	0.10	0.7

90 %

Reduced tests options:

Screening

Trial conduct with limited tests

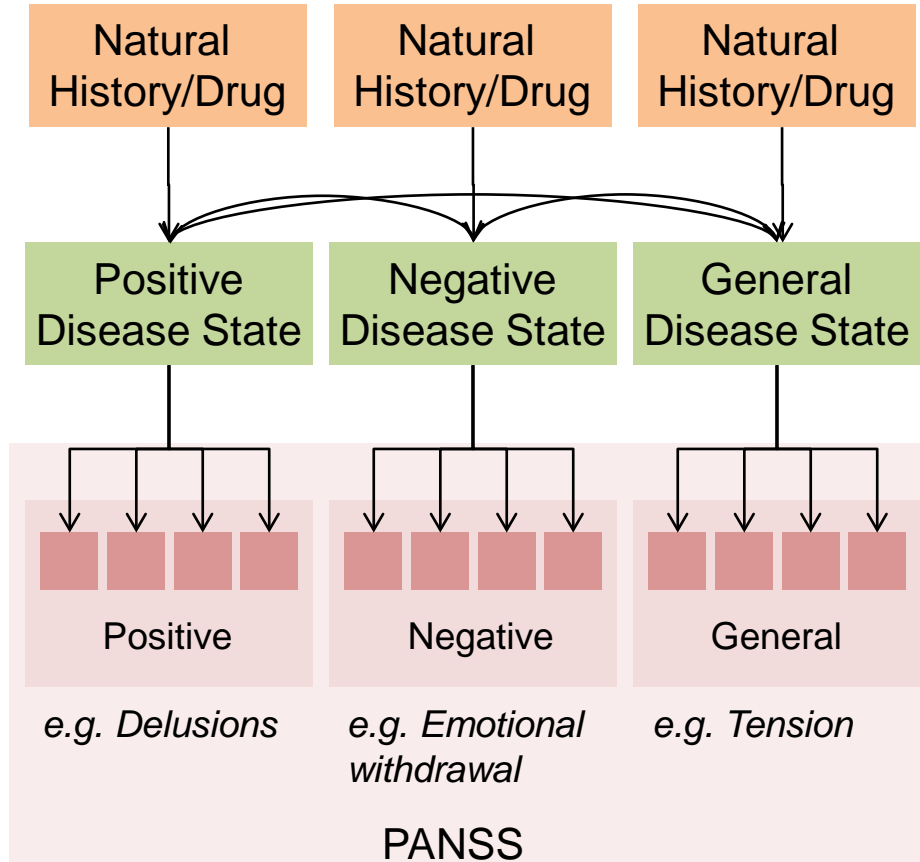

Trial conduct with individualized dynamic testing

tests administered to maximize information with few items

items can be selected to minimize learning effects

tests can be administered more frequently (device-based)

Example: Schizophrenia

+ Possibility to characterize different disease components in joint model

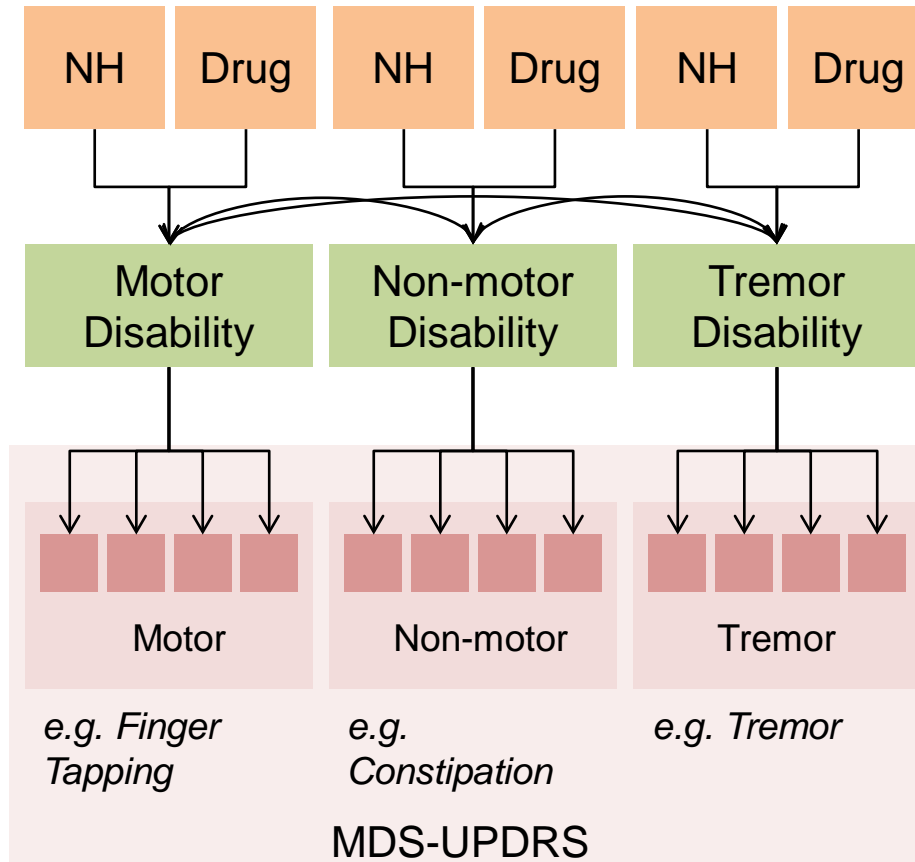

Figure 3 Longitudinal changes in disease state for typical individuals on placebo treatment (dotted lines) and paliperidone treatment (solid lines) for the positive (blue), negative (green), and general (red) subscale, according to our model.

Example: Parkinson's Disease

References:

Buatois et al. PAGE 24 (2015) Abstr 3417
 Buatois et al. PAGE 25 (2016) Abstr 5865

- + Possibility to characterize and identify different drug effects for different components of the assessment

$$D_v(t) = D_v^0 + \alpha_v \cdot t + S_v(t)$$

$$S_{Motor}(t) = E_M^0 + \beta_M \cdot (1 - e^{-k_{eq} \cdot t_d})$$

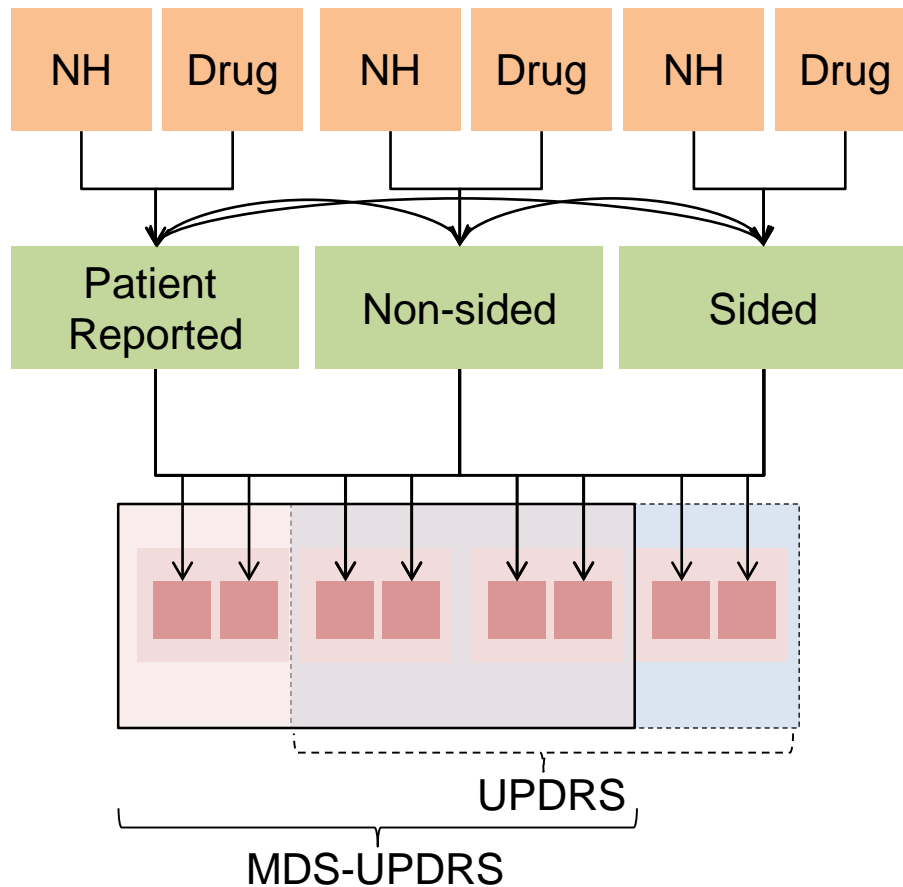

$$S_{Tremor}(t) = E_T^0 + \beta_T \cdot t_d$$

$$S_{N-motor}(t) = E_{NM}^0$$

- + Possibility to maximize power to detect drug effect by choosing subset

Example: Parkinson's Disease (2)

- + Model links established (UPDRS) and novel endpoint (MDS-UPDRS)
 - + Leverage historic data
 - + Comparison with older compounds
 - + Joint framework for complete disease severity range

- + Also done in AD for MMSE (often used for screening & diagnosis) & ADAS-cog (regulatory accepted endpoint)
 - + Utilize all collected data
 - + Leverage clinical routine data
 - + Predict clinical endpoint from screening

IRM-based diagnosis

IRT – challenges

- IRT analysis complex
 - Increasing community experience
- IRT model data demanding
 - #Items and #Observations can't be too low
 - Literature models can be used for ICC
- IRT model assumption dependent
 - Assumptions can be assessed through diagnostics
- Software limitations for IRT analysis
 - NONMEM/STAN flexible but offer few built-in facilitations
 - SAS/R has useful functions but restrictive in model scope

Conclusions

Score

- Composite assessment data is complex
- Simplification results in loss of information
- IRT allows to capture data complexity
- Combination with pharmacometric modeling yields
 - Higher sensitivity and flexibility to detect drug effect
 - Integrated framework to link different endpoints and populations
 - More precise and versatile trial design
 - ...
