- Pilot study

IV. Conclusion

I. Background & Significance

Hypertension and Cardiovascular Risk

Hypertension Globally

1.1 BILLION PEOPLE
worldwide have high blood pressure

Hypertension is a leading cause of cardiovascular disease and mortality worldwide

1/3
OF ADULTS
(78 MILLION)
Prevalence of hypertension in the United States

When your blood pressure is high:

You are **4x** more likely to die from a stroke

You are **3x** more likely to die from heart disease

of people who have a first heart attack...

of people who have a first stroke...

of people with chronic heart failure...

HAVE HIGH BLOOD PRESSURE

Hypertension Control and Hydrochlorothiazide (HCTZ)

1st Line Treatment

Uncomplicated Essential Hypertension

Hydrochlorothiazide Response

ONLY ABOUT HALF

Of hypertensive patients treated with HCTZ achieve blood pressure (BP) control

■ Controlled BP ■ Uncontrolled BP

Current Approach for therapy selection and BP control is

Suboptimal

Hypothesis

Integrating **metabolomics** with **genomics** would help identifying **novel biomarkers and pathways** associated with the inter-individual variability in response to **thiazide diuretics**

Aims of Study

1

Aim

Identify metabolites significantly associated with the BP response to HCTZ

2

Aim

Integrate metabolomics with genomics to identify novel pathways and biomarkers associated with HCTZ BP response

II. Materials & Methods

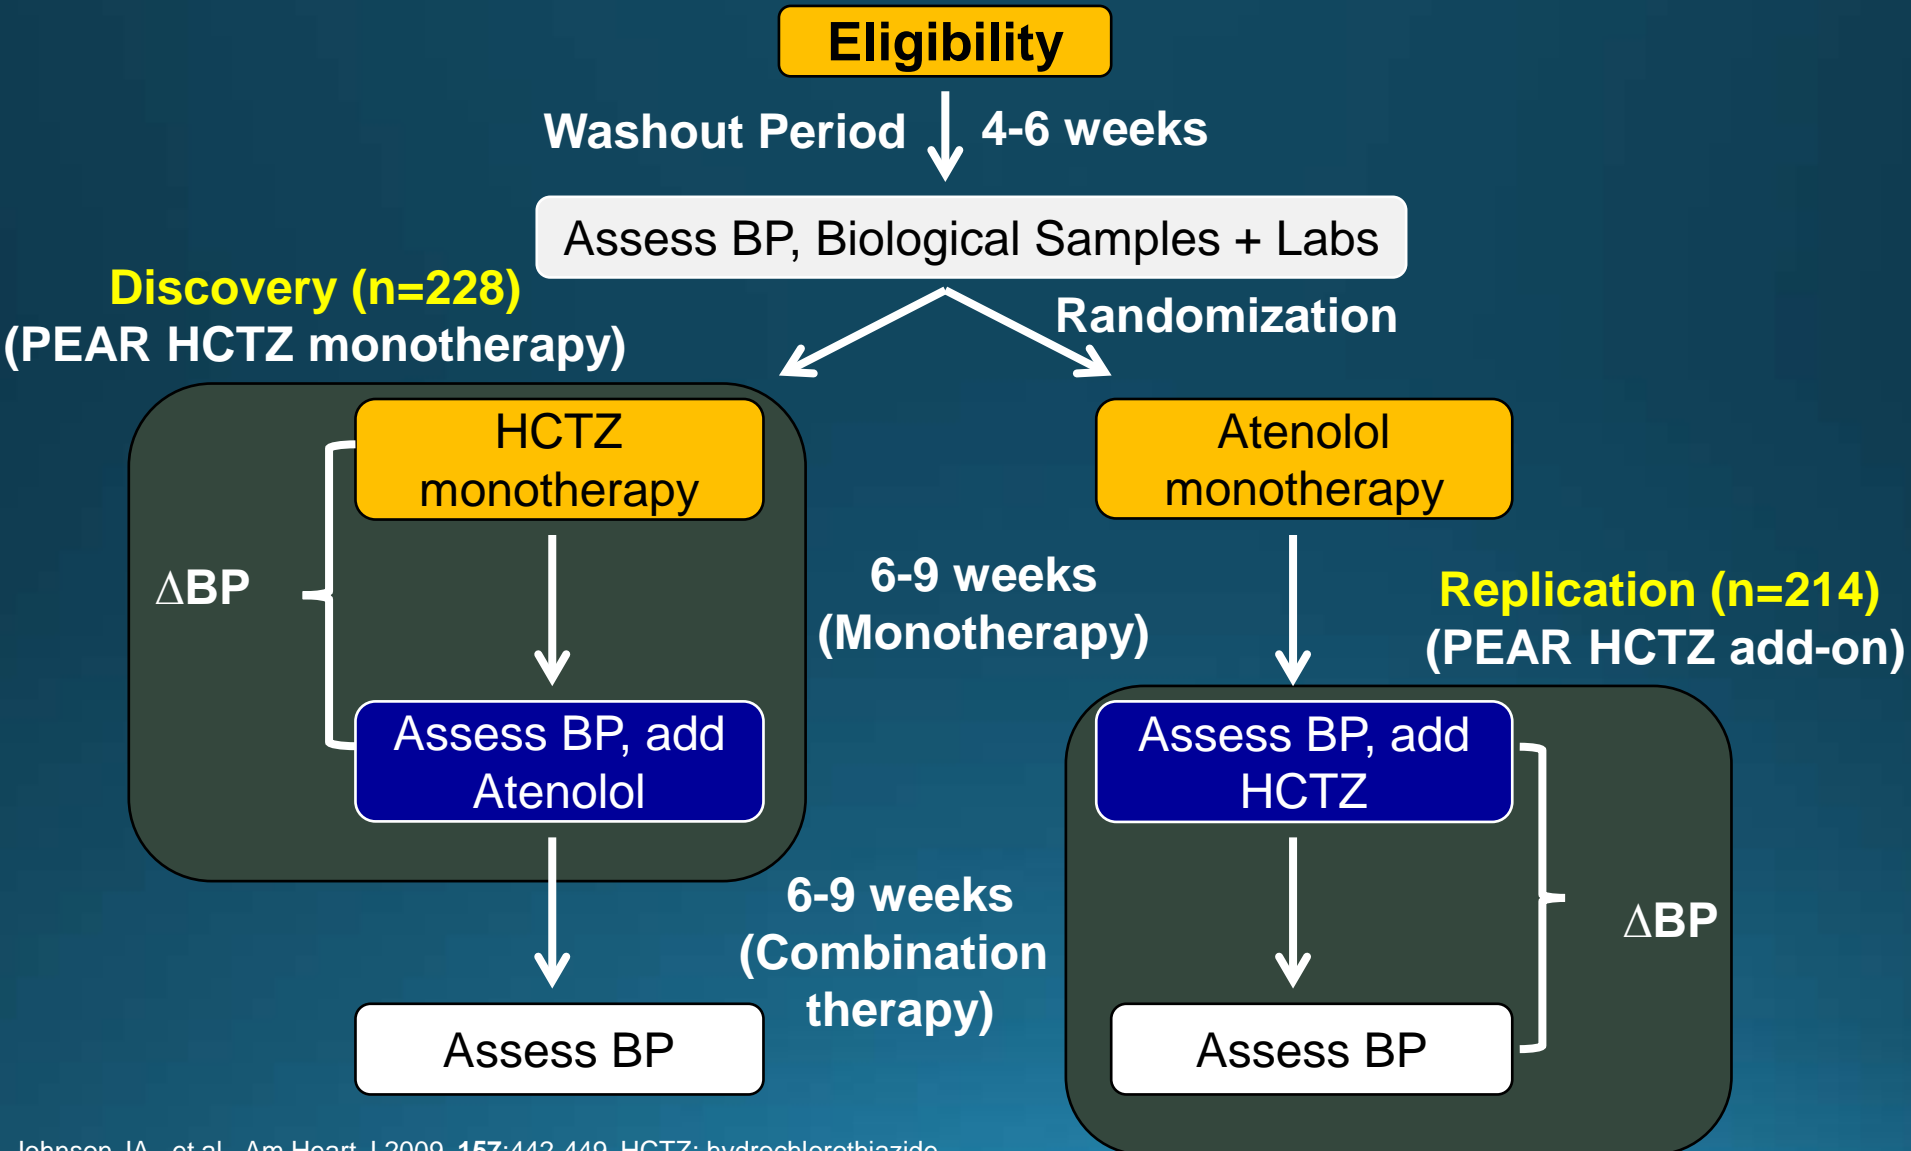

Pharmacogenomic Evaluation of Antihypertensive Responses (PEAR)

Clinical trials.gov # NCT00246519

- A prospective, multi-center, randomized clinical trial that recruited mild to moderate hypertensive participants
- Aimed to investigate the role of genetics on the blood pressure response and adverse metabolic events of HCTZ and/or atenolol

Pharmacogenomic Evaluation of Antihypertensive Responses (PEAR)

Metabolomics Experimental Setup

- Collected **baseline fasting plasma samples** from 123 European Americans (Whites) treated with HCTZ in PEAR
- **Untargeted** metabolomics profiling was conducted on those samples using **GC-TOF MS platform**
- We identified **212 structurally known** and 272 unknown metabolites
- Metabolomics analysis was performed through **Pharmacometabolomics Research Network**

PEAR Genomics Experimental Setup

- Genotyping was done for PEAR participants included in this study using **Illumina Human Omni1-Quad Bead Chip**
- Genotype call rates **>95%** and SNP call rates **>95%**
- MaCH software was used to **Impute SNPs** based on **HapMap III** haplotypes
- SNPs were excluded-**MAF** < 3%/ **imputation** $r^2 < 0.3$

III. Approach & Results

Analyses Framework

STEP1

Metabolomics Analysis

Identify baseline metabolites significantly associated with **HCTZ monotherapy** BP response (FDR<0.05)

STEP2

Genomic Analysis

Select SNPs with P-value< 5×10^{-5} from PEAR **HCTZ monotherapy** BP GWAS Analysis

STEP3

Genomics-Metabolomics Integration

STEP4

Replication

Replicate SNPs in PEAR **HCTZ add-on** therapy

STEP5

Create a Response Score

Create a HCTZ response score using replicated SNPs

STEP6

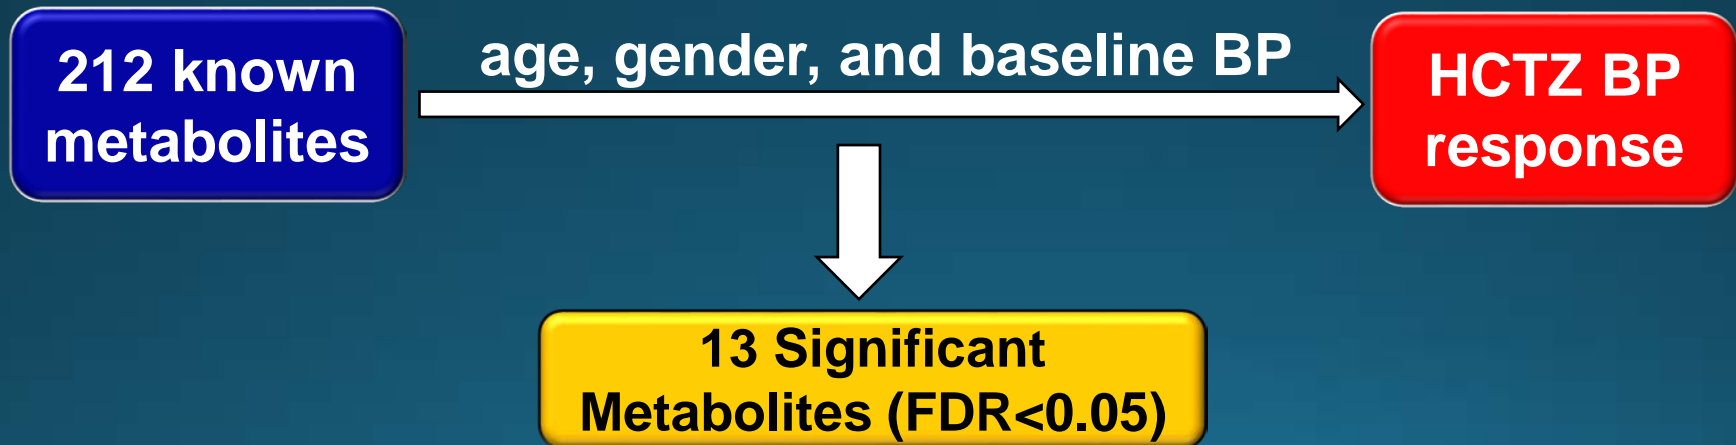

Response Score Replication

Replicate the response score in **GERA** participants treated with HCTZ

Step 1: Metabolomics Analysis

- A **linear regression** analysis was conducted to test the association between each metabolite and HCTZ BP response

Analyses Framework

STEP1

Metabolomics Analysis

Identify baseline metabolites significantly associated with HCTZ monotherapy BP response (FDR<0.05)

STEP2

Genomic Analysis

Select polymorphisms with P-value< 5×10^{-5} from PEAR HCTZ monotherapy BP GWAS Analysis

STEP3

Genomics-Metabolomics Integration

STEP4

Replication

Replicate SNPs in PEAR HCTZ add-on therapy

STEP5

Create a Response Score

Create a HCTZ response score using replicated genetic SNPs

STEP6

Response Score Replication

Replicate the response score in GERA participants treated with HCTZ

Step2: Genomics Analysis

GWAS SNPs
(Illumina Omni1-Quad Bead Chip – imputed Hap Map III)

Age, Gender, Baseline BP
and principal component 1,2

**HCTZ BP
Response**

103 SNPs
(p-values $<5 \times 10^{-5}$)

Analyses Framework

STEP1

Metabolomics Analysis

Identify baseline metabolites significantly associated with HCTZ monotherapy BP response (FDR<0.05)

STEP2

Genomic Analysis

Conduct GWAS and select polymorphisms with P-value< 5×10^{-5} from PEAR HCTZ monotherapy BP GWAS Analysis

STEP3

Genomics-Metabolomics Integration

STEP4

Replication

Replicate SNPs in PEAR HCTZ add-on therapy

STEP5

Create a Response Score

Create a HCTZ response score using replicated genetic SNPs

STEP6

Response Score Replication

Replicate the response score in GERA participants treated with HCTZ

Step 3: Metabolomics-Genomics Pathway Integration

SNPs at p-values
 $<5 \times 10^{-5}$
 (n=103 SNPs)

13 significant
 metabolites
 (FDR<0.05)

Pathway Analysis

Pathway Name	Genomics	Metabolomics	Pathway P-value
Netrin Signaling Pathway	<p><i>PRKAG2</i> rs2727563</p> <p><i>DCC</i> rs12604940</p> <p><i>EPHX2</i> rs13262930</p>	<p>Arachidonic Acid</p>	<p>1.54×10^{-5}</p>

Replication of the 3 identified SNPs with HCTZ BP response

PRKAG2

PEAR HCTZ monotherapy (n=228)

PEAR HCTZ add-on (n=214)

DCC

EPHX2

Analyses Framework

STEP1

Metabolomics Analysis

Identify baseline metabolites significantly associated with HCTZ monotherapy BP response (FDR<0.05)

STEP2

Genomic Analysis

Select polymorphisms with P-value< 5×10^{-5} from PEAR HCTZ monotherapy BP GWAS Analysis

STEP3

Genomics-Metabolomics Integration

STEP4

Replication

Replicate polymorphisms in PEAR HCTZ add-on therapy

STEP5

Create a Response Score

Create a HCTZ response score using replicated genetic signals

STEP6

Response Score Replication

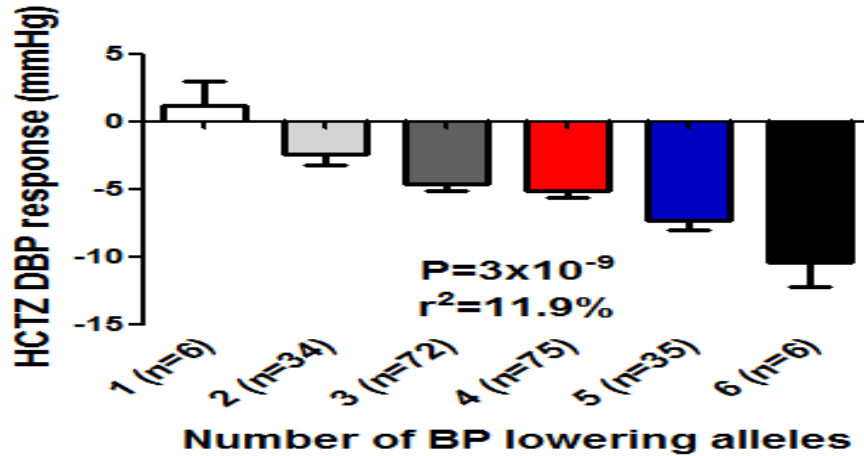

Replicate the response score in GERA participants treated with HCTZ

Thiazide Diuretics Genetics Response Score

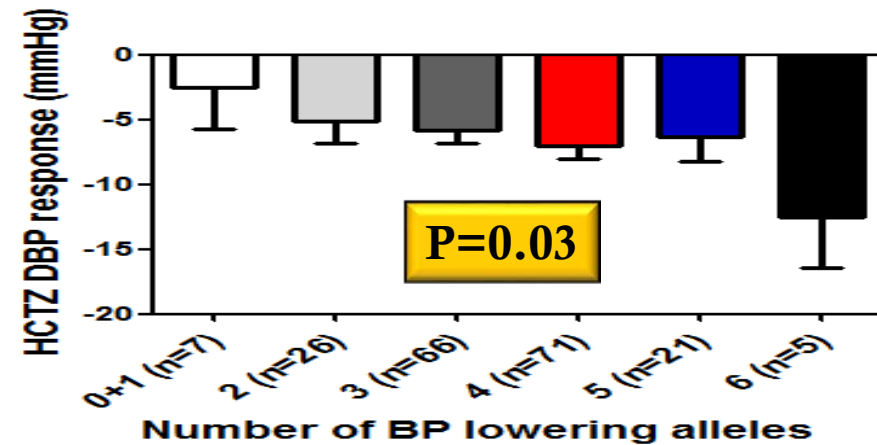

- Created based on 3 replicated SNPs:
PRKAG2 rs2727563, *DCC* rs12604940, and *EPHX2* rs13262930
- Points were given as follows:
 - Homozygous genotype with the greatest BP lowering effect = **2 points**
 - Heterozygous genotype = **1 point**
 - Homozygous genotype with the worst BP lowering effect = **zero**
- Alleles with BP lowering effect were then summed up for inclusion in a regression model
- Adjusted for age, gender, baseline BP, and PC1,2

Thiazide Diuretics Genetics Response Score

PEAR

GERA

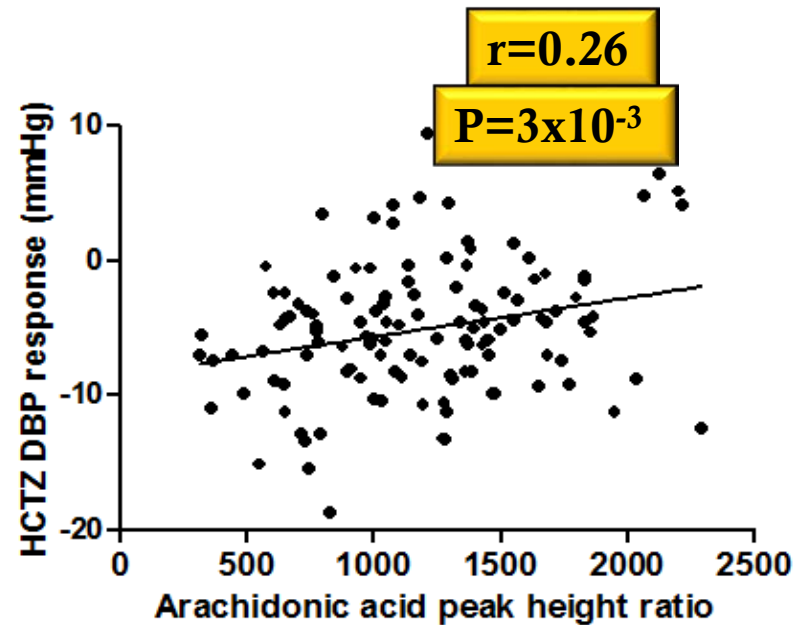

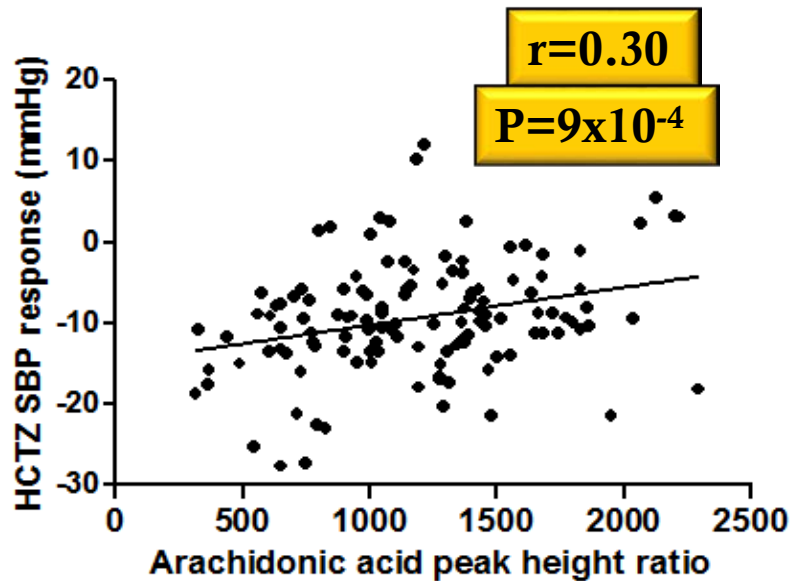

In Summary

- Identified **13 metabolites** significantly associated with HCTZ BP response
- Identified novel signals ***PRKAG2* rs2727563, *DCC* rs12604940 and *EPHX2* rs13262930** associated with HCTZ BP response
- **Replicated** in another **independent** group of patients treated with HCTZ therapy
- Using the **3 replicated SNPs**, we created a **response score** that explained **11.3%-11.9%** of the variability in HCTZ BP response
- **Replicated** this response score in another **independent group** of participants treated with HCTZ monotherapy

**Follow-up to the genomics-
metabolomics findings**

**Pilot Metabolomics Study
(Research in Progress)**

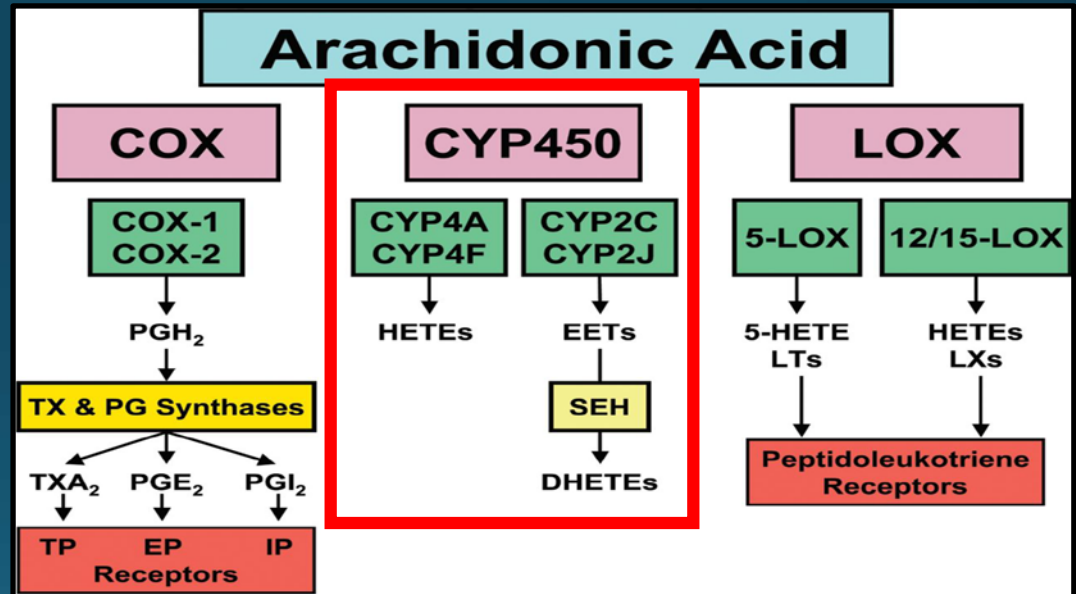

Genomics-Metabolomics Integration Findings

Arachidonic acid

- Arachidonic acid is a polyunsaturated omega-6 fatty acid
- Arachidonic acid metabolites (eicosanoids) have been involved in diverse signaling cascades associated with:

- BP regulation
- Inflammation
- Renal vascular tone
- Sodium transport

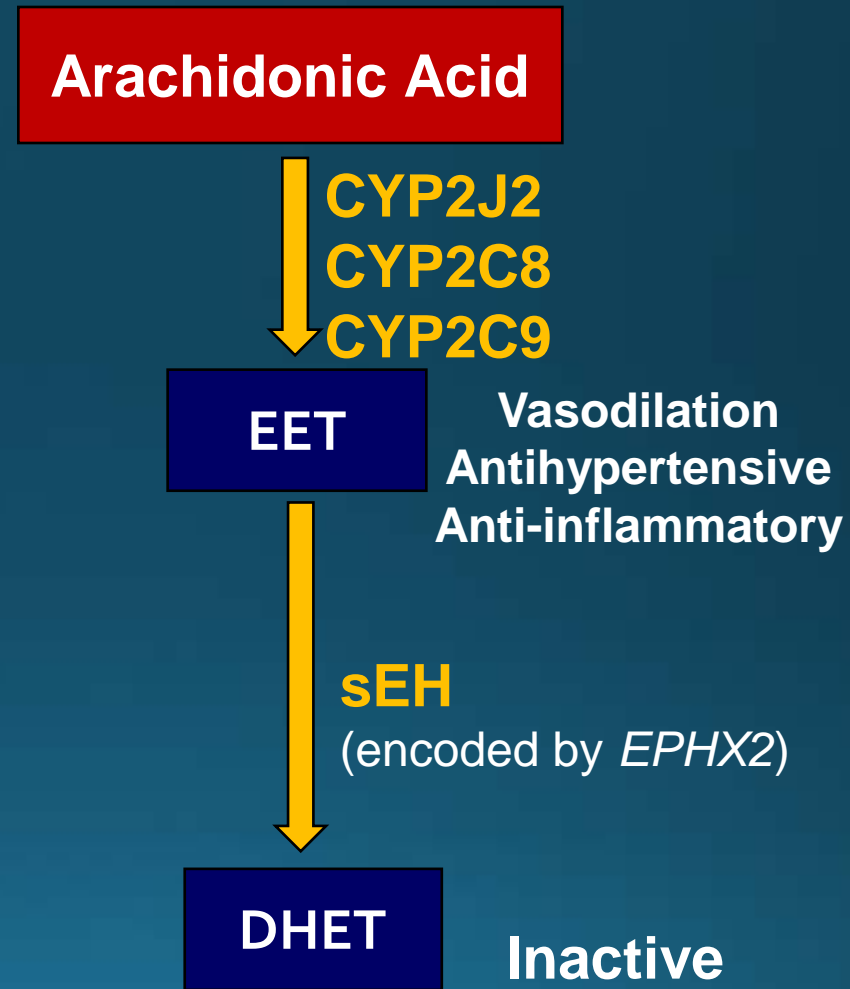

- Less is known about the association between arachidonic acid metabolites and BP response to HCTZ

Genomics-Metabolomics Integration Findings

Pathway Name	Genomics	Metabolomics	Pathway P-value
Netrin Signaling Pathway	<div data-bbox="736 472 1012 611"> <p><i>PRKAG2</i> rs2727563</p> </div> <div data-bbox="736 622 1012 761"> <p><i>DCC</i> rs12604940</p> </div> <div data-bbox="736 772 1012 911"> <p><i>EPHX2</i> rs13262930</p> </div>	<div data-bbox="1114 482 1530 634"> <p>Arachidonic Acid</p> </div>	<p>1.54×10^{-5}</p>

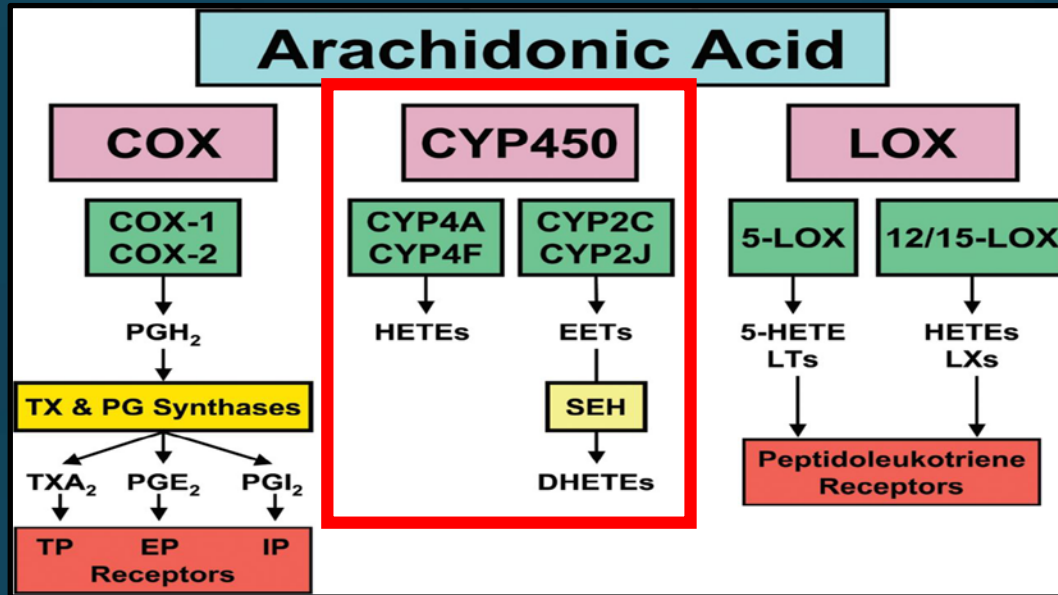

EPHX2 (Epoxide Hydrolase 2)

- HCTZ decreases the protein expression of sEH in spontaneously hypertensive rats
- HCTZ might be mediating its antihypertensive BP response via the inhibition of the sEH

EET: Epoxyeicosatrienoic acid
DHET: Dihydroxyeicosatrienoic acid
sEH: Soluble Epoxide Hydrolase 2

Research in Progress

Pilot Study

“Investigating the Implications of Eicosanoids on the Blood Pressure Response to Thiazide Diuretics”

In Conclusion

- Emphasized the strength of using multiple “omics” for identifying novel pathways and biomarkers associated with drug response
- Provided multiple levels of replication – which further substantiates the importance of *PRKAG2*, *DCC* and *EPHX2* as potential determinants of the BP response to HCTZ
- Replication in other studies could provide more evidence for using those signals in guiding the selection of HCTZ therapy
- Results from the pilot metabolomics project may help confirm the importance of these signals
